

## The PSI Mobile Digital Data Gathering Product Offering

### Overview

Our Digital Data Capture Solution is based on PSI Mobile's state of the art proprietary platform Fusion and can provide you live information on your projects wherever you are in the world.

- Fusion is a software platform enabling control and management of all aspects of the mobile digital data gathering environment.
- Fusion functionality includes:
  - user management (roles, groups, regions, etc.)
  - device management (pairing, lockdown, remote access etc.)
  - remote deployment of data capture templates
  - audit trails
  - storage of completed templates
  - export of CSV/Excel files
  - Reporting and Security.
- Completed data capture templates (jobs) can be stored either in the Fusion Management System and/or exported (Flat File, CSV, Excel).
- Our solution automatically synchronises completed data capture templates and jobs from the mobile device to the Fusion Management System immediately upon completion through PSI's synchronisation technology. In the event that a network signal is not available, the mobile device will retain the completed job / template until coverage is restored. The

job / template will then automatically synchronise without user intervention. Job / Template completion does not require network coverage.

- The solution provides a powerful Reporting module capable of delivering customisable management reports and analysis on the data captured.
- The solution contains multiple data verification and authentication capabilities to ensure accuracy of data.
- The solution enables notes, including photographs, voice notes, signatures and GPS data to be captured with the Job / Template and viewed by managers/supervisors and administrators.
- The Fusion application has multiple levels of security built in. The solution has been subject to a number of third party security audits instigated by enterprise customers and has demonstrated a high level of system security.
- Our Implementation team delivers integration, project management, application customisation, end user training and end user customer support based on customer's individual requirements and is supported by agreed service level agreements.

The solution has been proven to deliver the stability and scalability required to support worldwide projects encompassing many users. One customer is currently processing on average 4,000 transactions per day from approximately 400 users and has processed in excess of 1 million transactions in the past 12 months through the PSI solution at >99.9% availability.
